Set theory is the mathematical theory of well-determined collections, called sets, of objects that are called members, or elements, of the set. Pure set theory deals exclusively with sets, so the only sets under consideration are those whose members are also sets.

Introduction to naive set theory Fundamental set concepts. In naive set theory, a set is a collection of objects (called members or elements) that is regarded as being a single object. To indicate that an object  $x$  is a member of a set  $A$  one writes  $x \in A$ , while  $x \notin A$  indicates that  $x$  is not a member of  $A$ . A set may be defined by a membership ...

In mathematics, cardinal numbers, or cardinals for short, are a generalization of the natural numbers used to measure the cardinality (size) of sets. The cardinality of a finite set is a natural number: the number of elements in the set. The transfinite cardinal numbers, often denoted using the Hebrew symbol ( $\aleph$ ) followed by a subscript, describe the sizes of infinite sets.

Fraenkel, Abstract set theory. Fraenkel was the F in ZFC, and he gives a suitably rigorous development of set theory from an axiomatic viewpoint. Unfortunately, for the philosophical foundations of the axioms he refers to another book

(Fraenkel and Bar-Hillel, Foundations of set theory), which is missing from Eckhart Library. Good for culture.
